

Installation of Chrome Browser (without administrator rights)

(screenshots taken from a German installation)

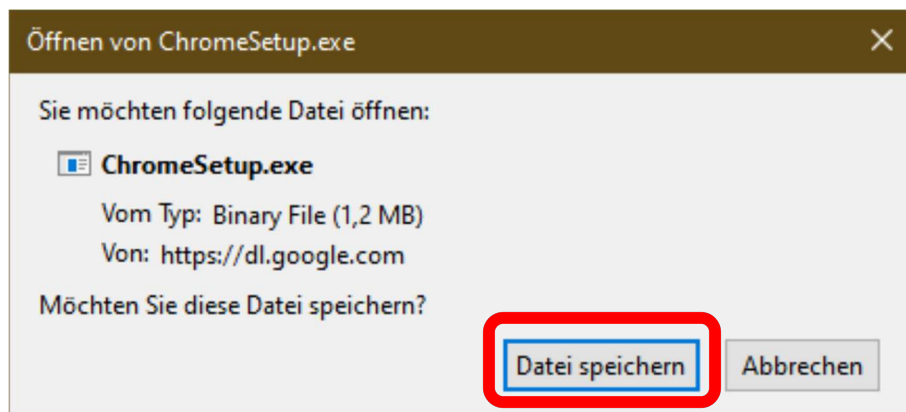

Official download website of Google Chrome:

https://www.google.com/intl/de_de/chrome/

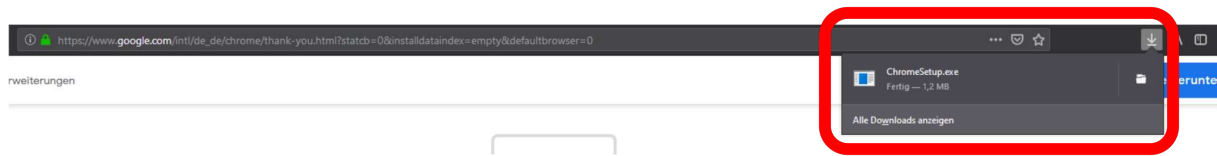

Please untick the checkbox on this page before downloading Google Chrome.

Click on the button "Download Chrome" and confirm the process in the next window.

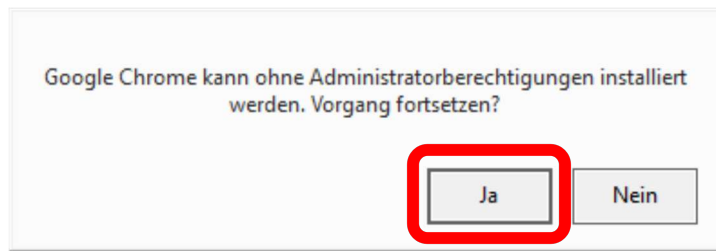

After successfully downloading ChromeSetup.exe, you need to start it. You will find the file either in your download folder or in your browser under the download icon in the upper right corner (here in the example with Firefox).

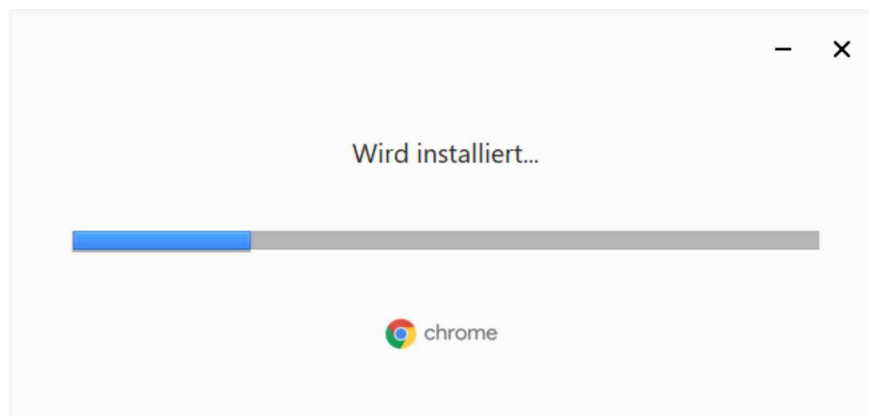

Start the ChromeSetup.exe from Firefox with a single click, or from the Windows Download folder with a double click.

After starting the file, a Windows window appears with the request for administrator authorization. This can be closed simply with the cross in the upper right corner to get the following message.

This message can be confirmed with "Yes".

You should then find a Google Chrome shortcut on your desktop.

It is not recommended by HZB to use Google Chrome as default browser, because many internal applications (e.biss, employee portal, etc.) are not tested for Google Chrome and HA IT can only give limited support for problems with this browser.

We do not recommend that you store your private/personal Google Account in the Chrome browser to prevent private data from being mixed with business data, or that business data such as passwords etc. accidentally ends up in your Google account.
